

CPD PRESENTATIONS

Airtight Membrane Systems

This presentation covers the importance of limiting air leakage in buildings, and the implications on building energy performance. It also provides an overview of relevant legislation and best practice, and discussion of internal and external air barrier solutions.

Condensation Control - Condensation in the Roofspace

This presentation discusses the requirements for breather membranes, air barriers and vapour control layers, looks at the principals of condensation, the effects of condensation, issues of detailing cold pitched roofs i.e. insulation, ventilation and underlay. It also looks at condensation controlling measures and the solutions.

Ground Gas Protection - Building on Contaminated Land

This presentation deals with the use of Gas Membranes and Venting Solutions to prevent harmful ground gases from entering buildings. It looks at the types of gases and their production, the sources of these gases, migration mechanisms and potential solutions to protect our structures.

Acoustics - Impact & Airborne Sound Solutions for Floors

This presentation examines the use of acoustic insulation for impact and airborne sound in party floors. It looks at what sound is, how it is carried, what effects transmission of sound has and some practical design solutions along with current Building Regulation requirements and testing methods.
